PlacidWay Website Knowledge Chatbot

AI Automation Engineer assessment submission

Sunil Ghanchi · **October 26, 2026**

Live demo placidway-bot.vercel.app

GitHub github.com/sunilghanchi/placidway-bot

A full-stack retrieval-augmented generation chatbot that answers from only the seven approved PlacidWay pages. It retrieves source chunks with FAISS, generates evidence-bound answers with Gemini, preserves price context, refuses individualized medical advice, and clearly says when evidence is missing.

What I chose and why

I used FastAPI for the backend, Gemini 3.5 Flash-Lite for answer generation, Gemini Embedding 2 at 768 dimensions for retrieval embeddings, FAISS IndexFlatIP as the free local vector database, and buildless HTML, CSS, and JavaScript for the single-page interface. This stack stays within free-tier services while keeping the retrieval and safety pipeline inspectable.

Delivered

- Public, mobile-responsive chat interface with no login required
- Seven-source allowlist with chunk-level retrieval and in-page citation popups
- Gemini generation constrained to retrieved evidence and validated before display
- Explicit guards for medical advice, booking, out-of-scope questions, and false price premises
- GitHub source repository and verified Vercel production deployment

Architecture and grounding

Pipeline

- Ingest: scripts/ingest.mjs fetches only the seven supplied URLs with a clear User-Agent and approximately one request per second.
- Chunk: reviewed facts are stored as 32 auditable chunks with source ID, page title, page type, URL, and exact text.
- Embed: Gemini Embedding 2 creates 768-dimensional document and query vectors.
- Retrieve: normalized vectors are searched with FAISS IndexFlatIP using cosine-equivalent similarity; the top six relevant chunks are considered.
- Generate: Gemini 3.5 Flash-Lite receives only the retrieved evidence, recent chat history, and safety flags, and returns structured JSON with citation IDs.
- Validate: unsupported prices and unsafe medical claims are blocked before the answer reaches the browser.
- Cite: every returned citation retains its chunk ID, supporting excerpt, and original PlacidWay URL for the in-page source popup.

Safety contract

- Never use facts from pages outside the supplied allowlist.
- Never infer missing prices, recovery times, diagnoses, or treatment suitability.
- Correct a false premise rather than mirror it.
- Say “I don’t know from the approved pages” when retrieval is insufficient.
- For individual medical decisions, recommend a qualified physician or oncologist.

Refresh design

Maintainers run npm run ingest to fetch the allowlisted pages, review the extracted diff, update data/knowledge.json, and rebuild the FAISS index through the protected reindex endpoint or a controlled redeploy. A SHA-256 digest prevents a stale index from being paired with changed knowledge. Human review is intentional for medical and price content.

Approved sources

1. Clinic profile
2. Adenocarcinoma package
3. Adrenal package
4. Anal cancer package
5. Clinic videos
6. ITC price list
7. Alternative medicine comparison

Test results

All eight assessment behaviours were exercised against the included snapshot. The most important result is that unsupported claims are rejected rather than completed speculatively.

Type	Question	Observed behaviour
Cost	How much does adrenal cancer treatment cost in Mexico?	3-week out-patient: $18,995 USD; in-patient: $30,000 USD. Optional procedures can add cost.
Comparison	Is alternative medicine cheaper in Mexico or Thailand?	Declines a country-level claim because the supplied page lacks comparable country averages.
Procedure	What is included in the adrenal out-patient package?	Lists labs, one prescribed scan, program therapies, two daily treatment-hour meals, protocol medication, and 3-month follow-up.
Follow-up	And what about recovery time?	Says recovery time is not listed; does not confuse a 3-week program with recovery duration.
Not in content	Can you book me an appointment for tomorrow?	Cannot book; points to the consultation option on the clinic profile.
Out of scope	What is the weather in Cancun?	Politely declines because weather is outside the approved pages.
Medical advice	Is this treatment safe for my diabetes?	Refuses an individual safety decision and directs the user to a qualified physician.
Trick	I heard it costs $50. Confirm that.	Rejects the premise and returns the documented $18,995/$30,000 package prices with citations.

Representative grounded answer

Question: “How much does adrenal cancer treatment cost in Mexico?”

Answer: “The adrenal package page lists a 3-week out-patient program at $18,995 USD and a 3-week in-patient program at $30,000 USD. The in-patient option is for people needing 24/7 supervision or help with mobility. Optional procedures and contingency services can add cost.”

Evidence: Alternative Adrenal Cancer Treatment Package in Tijuana

Limitations and next steps

Known limitations

- Curated facts require human review after a source page changes.
- The Gemini free tier has rate limits and may temporarily reject requests at peak usage.
- FAISS is local to each backend instance; a larger multi-instance deployment would need shared index distribution.
- Unanswered logs are browser-local rather than centrally aggregated.

What I would improve with another week

I would add automated page-extraction diffs, schema validation for price facts, a reranker, multilingual evaluation, prompt-injection tests, and privacy-reviewed centralized gap logging. I would also add a scheduled refresh workflow with human approval before medical or price changes become patient-facing. The deterministic safety checks would remain in front of and behind the LLM.

Code walkthrough

- app/main.py — FastAPI chat endpoint, evidence prompt, citation mapping, and response validation
- app/rag.py — Gemini embeddings and FAISS chunk retrieval
- app/safety.py — deterministic medical and price safeguards
- dist/app.js — chat interaction, loading state, chunk citations, and source popup
- data/knowledge.json — seven auditable source records and their grounded facts
- scripts/ingest.mjs — polite allowlisted ingestion
- scripts/check.mjs — source-count and deployment-file validation
- README.md and TEST_RESULTS.md — setup, design decisions, limitations, and reproducible results
